

Software Engineering and Design Case Study 1

Prof. Dr. Jürgen Vogel (juergen.vogel@bfh.ch) Prof. Urs Künzler (urs kuenzler@bfh.ch)

Task 1: Elaborate Use Cases

Given the Personal Insulin Pump (PIP) description in the CS2 introduction, try to identify the most common uses cases looking at the PIP system from a user's perspective.

1. Start by identifying the potential users of the system and try to elaborate the common use cases for each user type.

- Draw a use case diagram, which shows the involved users and their use cases and indicate the system boundary of what the PIP is actually doing.
 - Investigate if there are dependencies (i.e. include or extend relationships) between the uses cases in the diagram
- Select 3 use cases and write a detailed use case scenario for these use cases, including exceptions and/or error conditions as outlined in the lecture slides and the provided template

Task 2: Elaborate Activity Diagram

Given the Personal Insulin Pump (PIP) description in the CSL / introduction and the use case scenarios of CSL Task 1, elaborate an activity diagram for the 3 use cases which you detailed in task 1.

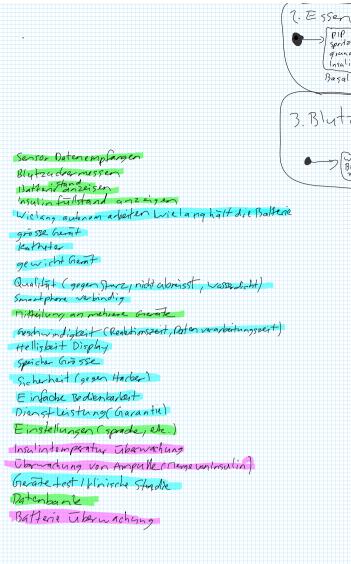

Given the Personal Insulin Pump (PIP) description in the CSA $\mathcal I$ introduction and the use case scenarios of CSA $\mathcal I$ ask 1, elaborate an activity diagram for the 3 use cases which you detailed in task 1.

Task 3: Elicitate Requirements

Given the description of the Personal Insulin Pump (PIP) in the CS 1 introduction and your results from Tasks 1 and 2, try to elicitate the requirements.

- Start with high-level user requirements.
- Then elaborate high-level system requirements.
- Detail these system requirements into:
- Non-Functional Require Domain Requirements
